NOTE. The following should be endorsed on the Cover of Report LS.T.D./C/317:

"This Fascicle should be read only in conjunction with the Amendments."

For details of contiguous Lines refer to:-

I.S.T.D./C/240	NORTH ITALY	Sept. 1943
I.S.T.D./D 324	MIDDLE DANUBE	May 1944
I.S.T.D. C/320	EASTERN FRANCE	Apr. 1943
I.S.T,D./C 320 Amdt. I	1)),	About to issue
I.S.T.D., C 316	NORTH-WEST GERMANY	Jan. 1944

INTRODUCTORY NOTE

In addition to correcting omissions and errors in the existing report I.S.T.D./C/317, the object of I.S.T.D./C/317A is to amplify the information already given in the existing report, particularly so far as the principal railway junctions and centres are concerned, and to provide a link with the Northern Italy and Middle Danube reports, by the inclusion of itineraries of the principal connecting lines from Italy and Western Austria.

AMENDMENTS TO I.S.T.D./C/317

Page I. Introduction

(1) For "Maps and Plans" read "Map of System."

Islandarios

Route 64. Amend "LAUTERECKEN-GROMBACH" to "LAUTERECKEN-GRUMBACH."

Route 65. For "Neustadt" read "Neustadt (Weinsta)."

Route 67. Amend to read "Kaplerühe-Graben-Neudorf-Mannhem-Darmstadt-Frankfurt."

Route 70. "Graden-Neudorf" should read "Graden-Neudorf."

Route 71. "NEUTADT" should read "NEUTADT (WEINTR)."

Route 78. Amend title to read "Birtightin-Backnano-Schwäß Hall-Herrintal."

Page 2

Route 84. Amend to read "Incolstant-Donauworth-Gunzburg."

Route go. For "Neustadt" read "Neustadt (Alson)."

After Route 91 insert "For revised list of itineraries including supplementary routes see C/317A."

Page 3. Introduction

Insert "C/317A has been prepared to cover additional selected lines in the quadrilateral area Frankfur-Eorn-Salzburo-Basel, with connecting lines from the Italian border."

1. MAP OF SYSTEM

Add "A further diagram has been prepared covering the supplementary routes described—see Plan r."

2. GENERAL DESCRIPTION OF SYSTEM

For "KARLSHRUHE" sead "KARLSRÜHE" and add the following to the list of Railway divisions:

ERSURT REGENSBURG INNSBRUCK

Add "The supplementary routes will cover principal routes running N. from Switzerland and Italy, and E. to Czecho-Slovakia, and Austria."

3. ORGANISATION AND PERSONNEL. (a) Organisation.

Fara. 1. After German State Railway insert "Se Plan 2 for diagram of Reichsbahn organisation."

Page A

Para. 4. State Railway Divisions.

After "NURSBERG" delete divisions and add "Erfurt, Regensburg and Innsbrück divisions."

Para, 9. Piniet Operating and Engineering Offices. Add of notify traffic matters are centrally controlled from the district.

Part, 14. Main Railway Repair Stops. Ar. A of para, add "The Andesseringswerke in the area covered by this report are at String it and Marchen."

Page 5

State Railway Contral Offices (Reichsbahn Zentralämter). Delete existing para, and substitute the following:

"The building and maintenance of rolling stock at the disposal of the German Railways (including Occupied Countries) is directed from the Reichsbahn Zentralamter (R.Z.A.), which also deal centrally with the question of stores, purchases, technical design and dev lopment for the whole of the Reichsbahn. There are two of these Lentral Offices, one at Berlin and the other at Muruch.

The internal organisation of each RZA is as follows: chairman, deputies, and auxiliary personnel.

Matters concerning wagon building are in the hands of a Hauptwagenamt—Berlin.

The Berlin RZA has the following experimental offices:

- For locomotives and motorised wagons— Grünewald.
- 2. For brake testing and research-Grünewald.
- 3. For wagons-Grünewald.
- 4. Chemical-Brandenburg-West.
- For testing bearings and castings for bearings
 —Göttingen.
- 6. For energy and heat economy—Tempelhof.
- 7. Chemical in Munich.
- 8. Mechanical in Munich.

In addition, the RZA Berlin is over the following offices:

The RZA Berlin office for street vehicles and traction machines in the garage on the Markgrafendamm.

Reception offices of the Reichsbahn:

BERLIN I DRESDEN MANNHEDE BERLIN II HAGEN MÜNCHEN BRESLAU KÖLN WIEN DOPITNUND

Coal reception offices in Essen and Gleiwitz.

Matters pertaining to the construction of new railway rolling stock are attended to direct by the Central RZA Offices.

Railway repair workshops are under the supervision of the RZA offices through the intermediary of the Generaldirektion d. Werkstatten (GDW). There are to of the latter and each of them has a group of workshops subordinated to it.

Generaldirektion d. Werkstatten:

Berlin Hamburg München Breslau Köln Stuttgart Dresden Königsberg Kasel "

After para, to insert the following:

** Floridat Administration Office (Elektrische Oberbetriebsleitung)

the a 15 stration of all electric traffic matters, power stations, and only a transformers, is directed

from Intalauck the regional managements being as Folkows:

Traffic (Electric Monagement)-

Merraletzina (RLin Beeslau) MULLENTEIN (RDB HALLE) MUNICHEN-PASING (Route 122) Innibacica (Router 121/3)

Power and Transformer stations are given under Section 7.

State Railway Construction Divisions (Reichsbahndirektion)

All road and building construction in the Reichsbahn is directed from two Reichsbahndirektion, one at München and the other at Berlin.

The München establishment consists of 27 offices, of which 1-19 control building, whilst the remainder deal with machinery and technical matters."

(b) PERSONNEL

After Reichsbahn (line 2) add "as a whole."

4 (a) Add at end of paragraph:

"The lengths of individual routes dealt with in this report are given in the preamble to each line description."

(b) LOADING and STRUCTURE GAUGE.

Structure Gauge: Lines 4, 6, 8, delete "Maximum" and substitute "Minimum."

Add the following paragraph:

"The structure and loading gauges for the Austrian Lines are the same as for the German lines."

- 5 (a) "width of rail" should read "weight of rail." Add "For sectional diagram of the standard S.49 rail see Plan 3.
- 5 (b) Add "For drawings of rail fastenings and permanent way components see Plans 4 and 5.
- 5 (e) Add "For sectional drawing of 'K' pattern permanent way on steel and wooden sleepers see Plans 5 and 6."
 - (d) Add "For sectional drawing of double and single track formation see Plans 7 and 8.
- (e) "1929 3683" should read "1929 3383." Paras. (g), (Y), and (i) should be (f), (g), and (h)

Section 5 (i), add note "see Section 15 on Mountain Railways" (C/317A, p. 4').

6 (b) SIGNAL TYPES AND ASPECTS.

Para, 2, liw 1. Delete "advance signals" to "disc type" and substitute "Distant signals (Vorsignale) are of disc type."

Lines 14 and 20. Delete "advance signal" and substitute "distant signal."

After para, 3 add "For various types of signals and their aspects see Plan 9.

Para. 3. live 11. Delete "advance", listant's signal," and substitute "distant signal."

(5) Friedmick ion. Delete whole so four indsubstitute the tollowing:

"In 1937, the Reichsbahn tystem included the following total length of electrified lines:

			Km.
Route length— Single Truck			599
Double Truck			1,639
Multiple Track	• •	• •	25
Total			2,263

Of the lines described in this report, including supplementary routes, the following are electrified:

82. STUTTGART-MUNCHEN

85.

Augsburg-Treughtlingen Nürnberg-Treughtlingen 87.

WORGL-ST. JOHANN-SALZBURG 124.

SPITTAL MILLSTÄTTERSEE-SCHWARZACH ST. 125.

Power for German lines is obtained from Hydroelectric stations which, in most cases, do not belong to the Reichsbahn but are State owned and also supply industrial establishments in the areas. With the exception of the lines in the Titisee area, current is supplied by overhead transmission on the standard system for German railways, i.e. 15 kV a.c. 163 cycles single-phase. The Höllental and Dreiseen Railways (Titisee) areas are supplied by power from the general supply system of the country (20 kV single-phase 50 cycle) by means of Scott connected transformers; transmission, as in the case of the other lines, is by the overhead method. Illustrations of overhead equipment in various areas are given in photographs 1-8.

The following is a list of the principal power stations:

(i) München Area:

- (a) Walchensee power plant—situated south of München, near Garmisch head, with Walchensee lake as water storage basin; 2 single-phase sets, each of 10,650 kVA.
- (b) Mittlere-Isar group of power plants— situated north-east of München: 4 single-phase sets of 12,000 kVA each, installed at the Eitting and Aufkirchen power plants; one transformer set of 18,000 kVA installed at Pfrombach power plant
- (ii) Salaburg Area:
 - (a) Saalbach power plant, near Bad Riechenhall.
 - (b) Gartenau power plant, near Schnellenberg.
 - (c) Mallnitz (Route 125).
- (iii) Stuttgart Area: Munster power plant.
- (i)v Basel Area: Ryburg-Schworstade (Rude 110),
- Rheinfelden (Route 117). (v) Imsbruck Aca: Ruetz.

Achienses North Lar.

(

The principal sub-nations are as follows:

Revule

Mallnitz, Schwarzsch-St.-Veit

125

The standard sub-station on the German State Railways comprises static transfermers at 5,000-6,000 kVA and the average distance between sub-stations is from 50-60 km. Voltages of transmission from the power stations to the sub-stations are between 8 kV and 10 kV."

Page 12

(8e) Insert at end of section "Illustrations of German steam locomotives, and schedules giving more detailed information on steam locomotives, are given in Plans 10-14. A schedule of leading particulars of electric locomotives is given in Plans 15 and illustrations of certain types in Photographs 4-6a."

Page 14

(8e) Insert "A revised list of locomotives depots is given in C 317A, p. 17, Table 1."

(8c) Add "For revised list of Railway Workshops see C/317A, p. 19, Table 2."

Page 16

After 8th paragraph insert, "For illustrations of German State Pailways Passenger Rolling Stock

Page 19

After and paragraph insert: "For illustrations of Freight Rolling Stock see Plans 17-17c."

(93) BRAKING EQUIPMENT

Para. 2 add: "Plans 19 and 20 give the layout and details of the Kunze-Knorr (Kkg) and the Hildebrand Knorr ("L.kg") goods brakes."

Para. 3 add: "Piar 18 illustrates the type of temporary fitting for unfitted vehicles, together with the method of fixing."

Para. 4 for "caboose" substitute "brake castle," and add "for illustration see Plan 176."

(9:) BUFFING AND DRAW GEAR

Para, t add: "Plan 22 illustrates both types employed."

Para. 2 add: "For illustration see Plan 21.". Para, 3 add: "See Plan 23."

(M) ROLLING STOCK WORKSHOPS

Add: "for revised list of workshops see C 317A. p. 19, l'able 2.

Page 20. Traffic

(120 Add: "The following statistics given by Dr. Consequaller, Secretary to the German Min's

try of Transport, in his speech on 7th December, 1943, illustrate the increase in traffic experienced by the Reichslahn since the outbreak of war.

Passenger traffic	1932 millions	1998 millions	1'342 millions
No. of pattengers, excluding forces	1,305	1,975	3/100
Passenger/Km Gods traffic	30,811	56,123	. 83,428
Net ton/km. Axle/km.	44,410 13,499	88,525 23,391	457,591 36,595
Train/km. Wagons placed	191	. 314 45	477, 45

(10) WEIGHTS AND SPEEDS OF TRAINS

Para. 3, line 3. Delete "The average" to "net" and substitute: "The average main line goods train in war-time may be taken as carrying at least 500 tons net."

Add after para. 5: "The following regulations regarding maximum speeds applied in 1929, and although, as indicated in the preceding paragraphs, improvements to track and rolling stock since then may have allowed for higher speeds for certain classes of train, the basic principles can be taken as mill applicable:

			•	Main lines	Sub-

300 m.			• • •	40.5	
2,50 m.				31;	31 0
130 m.			٠.,	28.3	23.0

Other general speed restrictions are as follows:

18-5 m.p.h. for all trains on subsidiary lines, and for goods and military trains on main lines.

28'0 m.p.h. for stopping and passenger trains, rail motors and light engines on main lines.

15'5 m.p.h. when propelling on main lines, to m.p.h. when propelling on branch lines and all crossings are not protected.

Trains banked in rear must not exceed 37-5 m.p.h. and if the automatic brakes fail and the train is worked by hand brake, 31-3 m.p.h. may not be exceeded on main lines, or 22 m.p.h. by goods trains on subsidiary lines."

Page TT

For revised list of Marshalling Yards see C/317A, p. 20, Table 3.

12. VULNERABILITY OF SYSTEM

Add after para. 1:

"The density of the railway network is not so apparent as one proceeds E. and S., where, although alternative routes still apply, the use of them entails considerably greater train kilometrage than obtains on the direct routes, and the cutting of lines at selected junction points can cause considerable inconvenience in maintaining communications to France, Austria, and Italy.

Key junctions are given in the preamble to each line description and in the case of the supplementary routes are indicated, together with other particularly vulnerable points, by an asterisk in the text."

Page 24

12c. ELECTRIC RAILWAY POWER STA-TIONS AND INSTALLATIONS

Add: "The power stations serving the supplementary lines are referred to in Section 7."

12d. TRAFFIC CENTRES AND MARSHAL-LING YARDS

Add: "A revised list of Marshalling Yards is given in C/317A, p. 20, Table 3."

14. ITINERARIES

List of Abbreviations.

Add mg = maximum gradient mrc = minimum radius of curves "

Last line, delete "beginning" and substitute 'end," and add: "a map indicating all routes described, including supplementary routes, is given as Plan 1 of C/317A."

Add the following paragraph: "Map sheets of G.S.G.S. series 4081 and 4416 have been used in line descriptions."

After Section 14, add the following:

"(15) MOUNTAIN RAILWAYS

The railways in S.W. Germany run through the mountainous regions of Bayaria, Wurtemberg and Bulen, so that many steep gradients are encountered. Gradients are as much as 1/25 on the electroided line between Bad Reichenhall and Berchtes gaden ove R ale 100%, 1, 40 at Neuenmarkt (Raile 101), and also on the Munchen Berlin main line, between Hochstadt and Probstrella for also Rude 1/1%, 1/4% on the Geidingen gradient (Raile 201), and 1/2% between Schweinfint and Erfint 10/2%, and 1/2% between Schweinfint and Erfint 10/2%, a 10/2%, all et which are tomes for mala line set vices.

In addition there are local trace serving the money more distracts where, although specific nearly traces on the model do, important the project forms of the control of th

necessary for the line to make considerable detunes to avoid probabilities gradients. An autotauding example is to be found on Route 113a between Weizen and Blumberg, where the distance as the crow flies is only c. 10 km., and the line makes a detour of 25.5 km.

On the Black Forest Railway (Route 112), in spite of its 1/50 gradients, it is necessary for the line to cross the central range by a double spiral and a helical tunnel between Hornberg and Nussbach, to make good the difference in altitude of soo m.

The Murgtalbahn, branch of the Black Forest railway, has a maximum gradient of 1/20 between Hausach and Freudenstadt, and the 0-10-0'l' locomotives employed on this line can haul only 3 or 4 four-wheeled vehicles.

Endeavours have been made to improve services on mountain lines by the introduction of appropriately designed locomotives for fast trains, and as a result the 4-8-4 type has been brought into operation, designed for a speed of 140 km. (87 m.p.h.). In addition, the dead weight of rolling stock has been considerably reduced on those lines.

The 2-10-2 tank locomotives, used inter alia on the Hollenthal Railway, enable high speeds to be maintained on lines of heavy gradients and sharp curves, and can be operated over curves of 100 m. (5 chains) radius. The flexibility is obtained by the use of Luttermöller axles or Schwartzkopff-Eckhardt trucks. An example of a 2-10-2T Class locomotive is given in photograph 32.

(a) RACK RAILWAY

(i) The Baden-Hollenthal railway was originally constructed for rack working over the steepest gradients, but the introduction of the 2-10-2 tank locomotives and electric traction has enabled the rack system to be abandoned.

Gradients on the adhesion section reach as much as 1/40, and the minimum radius of curves is 300 m. (15 chains), whilst on the old rack sextions, which may have been improved upon electrification, the figures were 1/18, and 260 m. (13 chains) radius respectively.

- (ii) The Ilmenau-Schleusingen (Thuringerwald) Railway, a local line with connection to Route 101a, comprises 30 km. of standard gauge adhesion railway and 5 sections, a total length of 6,240 m., of Abt rack railway, with maximum gradients of 1/40 and 1/17 respectively, and curves of 250 m. and 200 m. radius.
- (iii) The Bavarian Wegscheid Line, between Erlau (near Passau) and Wegscheid has 1,610 m. (1 mile) of rack railway in 2 sections.
- (iv) The Reutlingen-Schelklingen line connecting Routes 115 and 116 has, between Honau and Lichtenstein, a rack section of 1,990 m. (1°24 miles), and speeds are restricted to to km. per hour both up and down.

In addition there are 2 rack railways constructed purely for tourist traffic, one between Stuttgart and Degerlock, and the other from Brannenberg (Rotte 123) to Wendelstein. The latter climbs from 472 to 1,790 m. (1,548 ft. to 5,873) above sea level.

Photograph 33 gives leading dimensions of German rack lecomotives.

AFRING CAMERWAYS

In both Germany and Austria cables use have been developed for passenger traffic, although the eatliest were constructed for goods only.

The general principle is that vehicles are suspended on a curier cable and driven up by a trution orbit. High speeds are trained; that

of the Kreizeckladin and Wankbalin hear Partene | kirchen, Route ear) and the Predige Astahn (near Bad Reichenhall) (no photographs 19 146) being 5 m. per second. The Juguine, the highest peak n the Bavarian Alga, is served by two cableways (telpher lines), one from the German side and one from the Austrian. The former includes a one-metre gauge adhesion railway from Garmisch to Grainau (58 km.), with yeadients of 1/27, and a rack section thence to Schne fernerhaus, with gradients of 1/4 and a 4,4% m. tunnel.

The Nelselhornischn, which runs from Oberstdorf in the Kempton area, climbs from 843 m. to 2,969 m. above sea level, and is one of the longest in the world.

Photograph 34 illustrates profiles of certain German telpher lines

The Austrian cableways, of which there are twelve, have a total length of 30 km. (18-6 miles), and a total height of 11,050 m. (over 11\frac{3}{2} miles), and in normal times carry about a million passengers yearly. Most are built on the Zuegg system which gives a long distance between supports, and by the use of high-tension cables enables high speeds to be attained. Speeds are up to 4.5 m. (14) ft.) per second, and as a rule double lines are one ascending and one descending. Installations are provided in some cases enabling additional vehicles to be attached or detached as required.

The most recently constructed is the Galzig The most recently constructed is the Galzig line, opened in 1937. The length is 2,600 m. (2,843 yds.) rising through 77~ m. (842 yds.). The cables have a tensile strength of 200 kg. per sq. mm. (127 tons per sq. im.) and the factor of safety of load to initial tension is 3.5 for the carrier and 4.5 for the traction cable. The cable is 57 mm. (2\frac{1}{2}\text{ in.}) in diameter, and speed reaches 6 m. (19.7 ii.) per second, the journey occupying 7\frac{1}{2}\text{ minutes.} The cars carry 30 passengers each and the hourly capacity is 200 passengers in each direction, the greatest capacity of all Austrian lines. direction, the greatest capacity of all Austrian lines.

The high degree of safety experienced on all the Austrian cableways has led to the elimination of safety-catch devices, allowing for higher speeds.

Photographs 20 and 21 indicate the location and altitudes of the Austrian cableways and photographs 15-17 illustrate specific examples.

FUNIQUEAR RAILWAYS

There are two funicular railways in the Irinsbrück area, the Nordkette and Hungerburg lines, illustrations of which are given in Photographs 18-19."

Page 25

Route 51. In list of MY add "Apach (Moselle)" and "Konz-Karthaus."

Apach. Under details and facilities add "MY-E. of station-group of LS average length 850 m.."

ROUTE .

MAINZ-WORMS-LUDWICSHAPEN

General Description

Connecting at Mainz with Router 33 and 34, and at Ludwigshafen with Router 63 and 69, this line normally provides the most important route for trains from the N (Ruhr) Area to Karbrithe and the S. Owing, however, to the destruction caused by Lombing, traffic between the Ruhr and the area S of Karbrühe is reported to have been diverted via Winden-Neustadt-Kaiserslautern. Other important junctions are at Mains with lines E to Frankfurt and Darmstadt (Router 34 and 93), at Worms with Route 34 from Langmeil, Kaisersleutern, shid the Saar to Darmstadt, Frankfurt, and the NE, whilst at Ludwigshafen, Router 65 and 99 precide the main W to E cross country route (Saar region to Würzburg, Nürnburg and Schweinfurt)

The line follows the left hank of the Rhine and gradients will not be severe.

General Ditalle

ROUTE SAA

MAINZ HBF-ALZEY-MONSHEIM

General Description

Although ST, except where it runs in common with the Bingerbrück-Marnheim line, this line has proved important as an alternative route for traffic from Mains, Worms and Neustadt, upon the uisloca-tion of the main lines as a result of air attacks.

Gradients have a general tendency to rise rather steeply between Mains and Alzey, and fall from Alzey to Monsheim.

Principal junctions are at Mains for the main lines to Koblenz, Wiesbaden and Frankfurt (Rouse 54)
—at Armsheim and Alzey for the ST line Marnheim
to Bingerbrück and at Monsheim with the main line
Kaiserslautern to Worms, Darmstadt and Frankfurt

Engineering works are .ot considerable although several minor rivers and streams are crossed en route.

MA NZ-GROSS GERAU-DARMSTADT-ASCHAFFENBURG

General Description

Connecting with Route 54 at Mainz and with Route 36 at Aschaffenburg, this line provides, together with those routes, the main through service from Kölm and the Ruhr area to the SE and Austria via Würzburg, Nürnberg and München.

The most important junctions en route are at Gross Gerau and Darmstadt with Routes 93 and 67 respectively, giving main line connections from the Saar, Karlarühe and the S.

Gradients, which will not be severe, have a tendency to rise for the first 4300 km., and thence gradually fall towards Aschaffenburg.

The most important bridges occur at 3:1 km, where the line crosses the Rhine, and at 66-5 km, over the R. Main, but in addition numerous bridges over tributaries are encountered in crossing the valleys of both street.

General Details

ROUTE 93A

DARMSTADT (NORD)-EBERBACH

This line, although ST, is of some importance in linking Route 93 and 97 to provide a route for traffic to Stuttgart via Neckarela and Heilbronn alternative to that provided by the main lines via Mannheim and Heidelberg.

Heavy gradients may be experienced, as the line passes through hilly country, but they are minimised by following the winding course of rivers for the whole way.

Several minor rivers and streams are crossed en route and vulnerability is increased by two long tunnels, one at 30.3 km. (c. 1-1 km. long), and the other at 59.4 km. (c. 2-8 km. long), where the line passes from one valley to another.

In addition to the junctions at Eberbach, an important junction gives connection with the ST line whilst at Reinheim (19.3 km.) and important single track local lines Dieburg and Aschaffenburg respectively.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.
- 2. LENGTH: 81.5 km. (50] miles).
- 3. TRACK:

Darmstadt Nord-Darmstadt Ost, double. Darmstadt Ost-Eberbach, single.

4. Maximum permissible axle löad:

Darmstadt Nord-Wiebelsbach-Heubach, av metric tons. Wiebelsbach-Heubach-Eberbach, 16 metric tons.

- 5. MAXIMUM GRADIENT: 14 per mille (1 in 70).
- 6. MINIMUM RADIUS OF CURVES: 400 III.
- 7. TRACTION: Steam.
- 8. MARDIUM DISTANCE BETWEEN STATIONS: 7·4 km. (41 miles).

(KAISERSLAUTERN)-LANGMEIL-WORMS-BIBLIS-GROSS GERAU-FRANKFURT

General Description

Connecting with Reute So at Langmeil, this line provides a main line service from the Saar to Frankfurt and beyond.

Important junctions at Worms (with Reute 92), Goddelau-Erfeiden and Gross Gerau, give through main line services to Mains, Darmstadt and Wiebnden, whilst at Biblis the line is joined by the main line from Mannheim (Reut: 95). Less important, although by no means unimportant, junctions at Marsheim and Monsheim (Route 92s) connect with the ST lines to Bing: 'wick (Route 54) and Mainz.

The line takes a general direction E along the liey of the E. Pfrison to Worms when it turns NE using the Rhine at 41-7 km. by a bridge 96: m. ug, and the Main at 98-8 km. by a bridge s83 m.

patours are even for most of the routs and unto as well as curvature will be easy.

- 1. GAUSE: 1435 mm. (4 ft. 8} in.). Standard.
- 2. Lauern: 100-0 km. (631 miles).
- 3. TRACE: Double.
- MAXIMUM PERMINDLE AXLE LOAD: 90 metric 10

- 5. MAXIMUM GRADIENT: 9 per mille (1 in 110).
- 6. MINIMUM BALLUS OF CURVES: 352 M.
- 7. TRACTION: Steam.
- 3. MARIMUM DISTANCE BETWEEN STATIONS: 91 km. (51 miles).
- 9. Engins minus: Worms, Frankfurt Hbf.
- 10. MARSHALLING FACILITIES: Frankfurt.

MANNHEIM-BICLIS

ral Descrip

This line, which is DT throughout, connects the important railway centre of Mancheim with the main important raiway center to Mannier with the main line from Worms, K. serslautern and Spartbrucken to Darmstadt and Fo. furt at Biblis (Roste 94), and together with Roste 94 index a main line service between Mannheim and a antifurt alternative to that provided by Route 67.

The line follows the right bank of the Rhine through flat country and no heavy gradients or restrictive curvatures are likely to be encountered.

The principal bridges on route are those over the Neckar at 3-8 km., and over the Weschnitz at 25-9 km.

ROUTE A

FRANKPURT-HANAU-SCHLÜCHTERN ELM GEMÜNDEN-WAIGOLSHAUSEN

General Description

This line provides an alternative though devices route from Frankfurt to Genticulen to that provided by Route 86, and from Genticulen to Waigolshauen offers a direct link from the Frankfurt area to Schweinfurt and Bunnlerg.

From Frankfurt to Schlüchtern the route is part of the main line to Berlin via Fulda, and from Elm to Gentiunden, part of the main line from Hamburg and Hanover to München.

The line runs through the Main valles to Hanau.

The line runs through the Main valley to Hanau, where it turns NE through the Wolfgang Forest and low-lying country to Gelnhausen, to enter the valley of the R. Kinzig which it follows to Schlüchtern.

After leaving Elm, the country becomes more hilly, and several tunnels are encountered before the line runs down the valley of the R. Sinn as far as Gemunden, whence it follows the Main valley to Wernfeld and finally the Wern valley to Waigol-

The most serious gradients and curvatures are likely to be encountered between Elm and Jossa, although curvature will be fairly severe throughout. Several bridges are crossed, the most important being those over the R. Main and R. Kinzig referred to under item 12 below. to under item 12 below.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.

General Description

Together with Rosts 99, this forms the main line from Mannheim to Würzburg and NE Germany.

The line runs through flat country to Heidelberg with a gradually rising gradient, but after Heidelberg it enters the hilly region of the Odenwald and more difficult gradients may be expected.

To minimise gradients, the line follows the R. Neckar, involving many curves, bridges over tribu-taries and several tunnels where bends in the river are too sharp for the line to follow.

An alternative route is provided between Neckar-gemund and Neckarelz by a ST line via Meckesheim, junction also for the ST line to Jagatfeld (Route 27s).

The principal junctions are at Heidelberg with the main lines fr. m Bruchaal and Karlsrühe, at Eberbach with the ST line from Darmstadt (Route 936), at Neckarels, with the main line from Heil-bronn, and at Osterburken with the main line from Jagutfeid, Heilbronn and Stuttgart.

ROUTE MA

NECKARGEMUND-MECKESHEIM-BAD FRIEDRICHSHALL-JAGSTFELD

General Description

Although, apart from the stretch from Neckarge-mind to Meckesheim which is DT, the line is ST, this route provides the most direct service between Heidelberg and Heilbronn for traffic from the Mannheim area to Sturgart and South Germany.

The country through which the line passes is rather hilly and, to avoid heavy gradients or the alternative of expensive engineering works, the route follows the course of the R. Elsenz to Steinsfurt, where it turns E after crossing the Elsenz, following the valley of the Irsen to its source and after climbing the summit between the valleys of the Alsenz and the Neckar descends along the Mühl to its confinence with the Neckar, which it crosses, and joins the main line (R.ule 99), at Jagstield.

Several minor bridges are entailed in crossing tributaries of the Elsens and that river itself, but the most important bridge is that over the Neckar at 45.7 km.

The principal junctions are at Neckargemund with Rode 97, at Meckesheim (10-5 km.) with the ST line to Neckarels which involves several numels, at Steinsfort with the ST line to Eppingen (State 74), and at Jagsteld with the main line Holbronn-Almabury (Ray 99).

ROUTE

BRUCHSAL-HEIDELBERG

Connecting with Nonte 67a at Bruchsal and Route 97 at Heidelberg, this forms part of the main line from Kartsrühe and the South to Würzburg and North-East Germany.

The route runs through the low-lying country of the Rhine valley, and gradients are not severe.

At Bruchal, in addition to the connecting line to Karlsrühe (Route 67a), junctions exist with the main line running W to E from Saarbrücken, connecting at Mühlacker with Route 75 (Karlsrühe to Stuttgart and München), whilst at Heidelberg, junctions also give connections E to Mannheim for Kaiserslautern, and to the main S-N lines to Darmstact and Frankfurt, and Worms and Mainz. These two important turt, and Worms and Mainz. These two important railway centres (Bruchusi and Heidelberg) present the most vulnerable points of the route, but in addition, whilst major engineering works are not considerable, numerous small bridges over tributaries of the Rhine increase vulnerability.

General Dinnis

HEIL TRONN-OSTERBURKEN-LAUDA-WÜRZBURG

seral Description

Together with Roster 77 and 75, this route forms the main line from Stuttgart to Würzburg and North-East Germany. The line follows an almost continuously winding course from Heilbronn, following in turn the valleys of the rivers Neckar, Jagst, Seckach, Umpfer, Tauber and Moos.

After leaving the Neckar valley at Jagstfeld, it ascends gradually to 200 m. at Zuttlingen, and 300 m. at Osterburken, where it joins the main tine from Mannheim (Route 97).

The hillside between the end of the Seckach and beginning of the Umpfer valley is pierced by a tunnel (at 64 o km.). At the end of the Umpfer valley the line descends to 200 m. and enters the wider Tauber valley, leaving it at Gerlachsheim and climbing again to 300 m. along the winding Moos valley. From Zimmern (at 94.5 km.) the ground is more open, though still at the 300 m. level. A second tunnel cuts through the hillside at 99. 1. 2.

At 121 9 km. (Heidings and West) there is a J with the Würzburg-Ansbach line (Route 86), from which point the line descends to the R. Main and crosses it by a bridge e. too m. long. At 126-1 km. there is a J with the Würzburg-Bamberg line (Route 100).

General Details

- 1. GAUGE: 1435 mm. (4 ft. 8} in.). Standard.
- 2. LENGTH: 127-3 km. (79 miles).

WÜRZBURG-SCHWEINFURT-BAMBERG

seral Description

The line runs common with Route 90 to the junction at 92 km., where it branches N through the valley of the R. Main to Schweinfurt, whence it closely follows the right bank of the river to Bamberg, junction for the UT electric line Berlin-Nurnberg (Roule 101).

Several minor tributaries of the Main are crossed, but the only major bridge is that over the Main at 964 km.

The principal junctions are at Würzburg, with the main lines to Nürnberg (Route 90), Ansbach (Route 86), Heidelberg and Stuttgart (Route 99), at Waigolshausen with the branch line from Gemünden (Route 96) which provides an alternative to Routes 86 and 100, at Schweinfurt with the main line from Meiningen, Leipzig and Berlin (Route 1006), and at Bamberg with Route 101.

ROUTE 100A

MEININGEN-EBENHAUSEN-SCHWEINFURT

General Description

Forning part of the main line from Berlin via Leipzig and Erfurt to Nürnberg, this route runs in a southerly direction from Meiningen, junction also for the ST line Eisenach-Meiningen-Coburg (Route 1018), to connect with DT main line Würzburg-Schweinfurt-Bamberg-Nürnberg (Route 100 and 101).

The line follows a winding course through a coession of valleys for e. 53 km., after which it runs cross-country to Poppenhausen (c. 68 km.). The remainder of the journey is down the valley of the R. Werra, tatil the line curves E to enter the valley of R. Main at Schweinfurt.

Heavy gradients may be expected, with a general tendency to fall towards Schweinfurt.

ROUTE 101

NÜRNBERG-FÜRTH-BAMBERG-HOCHSTADT-MARKTZEULN-NEUENMARKT-WIRSBERG OBERKOTZAU-HOF

General Description

From Nürnberg to Hochstadt, this route forms part of the main line to Leipzig and Berlin, whilst the section Hochstadt to Hof, which is not electrified, provides the main line service from Nürnberg to Dresden and also an alternative route to Leipzig, although sharp curves N of Hof are restrictive to speeds and wheelbase.

The line runs N to Bamberg up the wide Regnitz valley, keeping close to the main road, river, and Ludwigs Kanal. From Bamberg, it takes a wide northeasterly curve up the Main valley to Mainleus, whence it continues through a succession of valleys to Neueumarkt-Wirsberg. From this point it follows a more winding course through narrow valleys to Münchberg, ascending from 300 m. to 600 m. It then descends gradually through more open country, finally following the Sachs Saale valley to Hof (alt. 489 m.).

The most important junctions are at Nürnberg (see Plan 34), at Fürth (J with Rate 90), at 63.7 km. (J with Rate 105), at 05.0 km. (J with ST s.o. line connecting with Rate 1052), at 105.0 km. (J with DT s.o. line to Saalfeld), at Neuenmarkt-Wirsberg (J with ST s.o. line connecting with Rate 102), at 132.4 km. (J with Rate 107), and at Oberkotzau (J with ST s.o. line to Franzenshad and Eger).

The track is double throughout, being electrified as far as Hochstadt-Marktzeuln.

The line frequently crosses the main road and also many streams and small rivers. The most important bridges are the three over the R. Main at 1042 km., 1042 km. and 1049 km. Also, bridge over Ludwigs Kanal (at 62 km.), bridge over R. Rednitz (at 829 km.), bridge over R. Regnitz (at 127 km.), and bridge over the R. Sachs-Saale (at 1872 km.). There are no tunnels.

General Details

LROUTE 101A

MEININGEN-COBURG-LICHTENFELS

General Description

Connecting at Meiningen with Route roos to Schweiniurt, and running as a continuation of the ST line from Eisenach on the Kassel-Erfurt-Leipzig main line, this line, although mainly ST and of lowcarrying capacity because of the heavy grades and sharp curvature, provides the only main line service to Coburg.

The line runs SE from Meiningen, follows the valley of the R. Werra to Eufeld where it turns S to Coburg through rather hilly country, entailing heavy gradients and several viaducts over valleys.

After leaving Coburg, the line once more follows the valleys of rivers through the Lichtenfels Forest to Lichtenfels, where it joins the main DT line from Numberg to Berlin via Leipzig, and to Dresden via Hof (Route 101).

At Themar, a facing J connects with the ST line to Schleusingen which from there runs to Ilmenau as mixed rack and adhesion, and finally to Plaue on the main Schweinfurt-Erfurt line. The gradients on this line (the Thüringerwald Railway) are 1/40 for the adhesion sections and 1/17 for the Abt rack sections, with curves of 250 m. and 200 m. respectively.

Other connections with minor lines are at Eisfeld with a metre gauge line to Unterreubrunn, and a standard gauge ST line to Sonneberg, junction for Probstzella and Stockheim on the Nürnberg-Leipzig main electrified line, at Coburg with a ST branch line to Sonneberg, and at Ebersdorf with a further single track line to Neustadt, on the Coburg and Sonneberg

NURNBERG-SCHNABELWAID-KIRGHENLAIBACH-MARKTREDWITZ-EGER (CHEB)

General Descripei-

(i.e., me, which is steam-operated and mainly ITI, provides the route for the direct service to Eger (Cheb) on the NW frontier of Czechoslovakia, Karlibad and Deeden.

Junctions at Normberry (see Plan 34) connect with lines N to Bamberg, Leipzig and Berlin (Route 100), Würzburg (Route 70), W to Ansbach and Karlsrühe (Route 74), S to München (Route 87) and Regensburg and Passaut (Route 104), and E to Fürth and Pilsen Route 104). and Passati (Route 104), and E to Fürth and Pilsen (Route 103). En route, the principal junctions are at Schnabelwaid for Bayreuth, Kirchenlaihach for Bayreuth and Neuenmarkt-Wirnherg and for Weidern to the S, at Marktredwitz for the main line N to Hof, S to Weissu (Route 107), whilst at Eger the line divides into two DT main lines, one S to Karlshad, the other N to Plauen on the line Hof-Leipzig, and in addition ST lines connect SW to Wiesau on Participal and SE to Pilsen Route 107, and SE to Pilsen.

From Nürnberg the line follows the valley of the R. Pegnitz which at Hohenstadt turns sharply N and narrows considerably, following a winding course all the way, involving many bridges over the river and tunnels through escarpments in order to avoid very sharp curves.

Shortly after leaving Pegnitz, the line leaves the Pegnitz valley and turns NE to follow the valley of the Weiher to its source and continues to the Czech border through hilly country involving two more tunnels.

Gradients are severe and have a general tendency to rise all the way from Nurnberg to Eger.

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.
- 2. LENGTH: 151-4 km. (94 miles).

ROUTE TORA

SCHNABELWAID-BAYREUTH-NEUENMARKT-WIRSBERG

meral Description

Although only ST, yet by connecting with the main DT lines, Routes 101 and 102, this line provides the only main line service to Bayreuth, both from the Bamberg direction and also by the more direct route via Schnabelwaid.

At Bayreuth trailing junctions connect with a ST line from Kirchenlaibach (on Route 102) and with a ST local line from Kulmbach (on Route 101).

From Schnabelwaid to Neuenreuth, the line follows the valley of the R. Weiher and rising gradients may be expected, increasing after leaving Neuenrath when it enters rather more hilly country, before entering the broad valley of the Trebgast R. at Bavreuth which it follows for the rest of the journey,

NURNBERG HBF-NEUKIRCHEN-IRRENLOHE GUHWANDORF-CHAM-FURTH-IM-FALD

General Description

Forming the main route for trains from Nürnberg to Fürth on the Czechoslovakian border, this line runs DT in an easterly direction along the Peguitz valley to Hersbruck, whence it follows the narrow, winding valley of a tributary of the Peguitz, and after reaching the source crosses the wavershed and turns SE down the valleys of the R. Rosen and R. Ils to Amberg.

At Amberg the line leaves the Ils valley, and crosses the Freiholser Forest to Irrenlohe, where it joins and runs in common with Route 107 (DT main line to Regensburg Hbf) to Schwandorf.

After leaving Schwandorf the line branches away from Route 107 and crosses high forest land into the Regen valley to Cham, whence it turns NE and follows the R. Cham into the mountainous region of the Bohmer Wald to Fürth.

The principal Junctions are at Nurn'erg (see Plan 34); at Pommelsbrunn where a trailing connection with Roule 102, which runs along the other side of the Pegnitz valley, provides an alternative route from Nurnberg; at Irrenlohe and Schwandorf with Route 107, and at Cham with the ST branch line to Straubing.

The heaviest gradients will be between Hersbruck and Amberg, Schwandorf and Posing, and Cham and Fürth, whilst the sharpest curves will be between Hersbruck and Amberg, Cham and Fürth.

General Details

NURNBERG (HBF)-NEUMARKT-REGENSBURG-PLATITING-PASSAU

Ceferal Description

Provides together with Router & and go, the direct service from Frankfurt to Austria. The line, which is DI and steam operated throughout, proceeds from Di and steam operated throughout, process from Nürnberg in a south-easterly direction through hilly worded country to Regensburg, whence it runs through the wide Danuke basin to Pleinting, where the Danube enters hilly country and to avoid difficult gradients the line closely follows the right bank of the Danube to Passau on the Austrian frontier.

The principal junctions are at Nürnberg (see Plan 34), Regensburg (see Plan 36), Plattling with lines 8 from Landshut and Mühklorf and lines N to Regen and Eisenstein, and at Passau with the line to Linz and Vienna.

Gradients generally speaking will not be difficult, and the most severe will occur between Nürnberg and Regensburg, and Pleinting and Passau.

INCOLSTADT (MAIN STATION)-RECENSEURG HEP

General Description

This line connects the DT Munchen-Treuchtlingen (Route 67) with the DT s.o. Nurnberg-Passau line (Route 104). The line is steam operated throughout and ST except for 3.7 km. from Regensburg-Prüfening to Regensburg which is DT.

The line runs SSE from Ingolstadt for a port distance, then E to Manching, and for the rest of the way in a mainly NE direction to Regensburg.

There are no steep gradients.

The line follows the valley of the R. Donau (Danube); from Saal to Regensburg it follows it very closely with many curves.

There are a bridges across the R. Donau at 46-2 and 68-4 km.

Principal junctions are Ingolstadt for the ST s.o. line to Augsburg (Route 88) and the DT München-Treuchtingen line (Route 87), Regensburg for the DT s.o. Nürnberg-Passau line (Route 104), the DT s.o. line to Hof (Route 107) and the DT electrified line to München (Route 106).

. 73 *9	REGENSBURG HEF.		MY (at durgweinting). ES. Tbl. RpS. SER. Wb (40 t). Cr (15 t). (For station details, see Route 106.) J with DT 5.0. lines to Passau (Route 104) and Hof (Route 107), DT electrified line to München (Route 106).

MÜNCHEN HBF-LANDSHUT-REGENSBURG

Forming, together with Route 107, part of the main line from München to Leipzig and Berlin, the line first runs W from München, and branches away from the main lines to Stuttgart and Nürnberg to run NE along the wide valley of the R. Isar to Landshut, where it turns N to cross rising country and several minor river valleys, into the Danube basin, to Regensburg.

The principal junctions are at München with the lines to Stuttgart (Route 82), Treuvattingen to Nürnberg (Route 87), Innsbruck (Route 122), Buchloe and Kempten (Route 119), Rosenheim, Saltzburg and Innsbruck (Route 123); at Landshut with ST lines NE to Plattling, Eisenstein and Pilsen, and SE to Mühldorf, and at Regensburg where electric traction terminates, with main s.o. lines Nürnberg to Passau (Route 104), and Regensburg-Eger-Hof-Leipzig, Berlin (Route 107), and the ST line to Ingolstadt (Route 105). (Route 105).

Regensburg and München are 2 of the 3 most important railway centres in Bavaria, the third being Nürnberg, and both places are well equipped with marshalling and locomotive facilities, as well as railway workshops.

General Details

ROUTE 107

REGENSBURG HBF-SCHWANDORF-IRRENLOHE-WEIDEN-WIFSAU-MARKTREDWITZ-OBERKOTZAU-HOF

General Description

Connecting with Route 104 from Passau, Route 105 from Ingulatedt, and Route 106 from München, this from Ingelstadt, and Route 105 from München, this line provides the main-line service for traffic from those places to Dresden, Leipzig and Berlin, although 30 far as Ingolstadt is concerned a through DT main line via Nürnberg (Route 37) provides a more direct route. From Regensburg, the line branches N at the junction with Route 100 at 22 km. and, after crossing the Danube metable along the Bergen wellage to

the Danube, proceeds along the Regen valley to Regenstauf, where it crosses slightly hilly country to the valley of the R. Naab at Klardorf and follows the valley to Reuth near the source of the river, to continue thence for the rest of the journey through mountainous country, joining Route tos at Marktredwitz.

The most difficult gradients will be experienced between Regentrouf (1. km.) and Loisnitz (33°1 km.) and from We len (80-6 km.) to Hof.

(33°t km.) and from We len (80.6 km.) to Hof. Important junctions are at Regensburg (see Plan 30°), at Schwandorf and Irrenlohe with Reale 101 Numberg-Furth), at Weiden with the ST line to Surface at Markinedwice with the st line to Fger, at Markinedwice with the main line for Numberg of the 101 and also the ST line of Surface and also the ST line of the Fger.

Of the many bridges over rivers, several of which are not inconsiderable, the following details of the bridge over the Danube at 3.6 km. taken from air cover, are worth noting:

Flood opening on North approach:

Total length including abutanents c. 103 m., with clear span between abutanents of c. 83 m., composed of 5 spans of c. 77 m. (centre to centre piers) which are probably masonry arches.

The flood opening is followed by c. 135 m. of high, earth embankments, succeeded by a viaduct c. 612 m. long crossing the R. Danuba and long land on both

long, crossing the R. Danube and low land on both sides of it, and the entrance to a dock. This viaduct is as follows:

Visitact (North bank):

masonry or concrete arches of a ti m. opening

Over R. Danube: 5 lattice girder through spans c. 51 m. long (centre to centre piers) (2 piers in river).

V Sheet (S. 124 Sank See Four land) :

12 masonly or concrete arches of 1, 17 m opins

Over dock entrances one skew, through, build girder span of . I'm clear span the schole conduct comme DT.

ROUTE 198

MUNCHEN (HBF)-MUHLDORF-SIMBACH

General Description

The line runs in a NE direction from München to Walpertskirchen (42% km.), where it turns eastwards to follow the valley of the R. Isen to Mühlorf I for ST lines SW to Rosenheim (Rosts 109), SE to Preilassing (on Route 124), and N to Neumarkt St. Veit J for Landshut on the München-Regensburg main line, Landau on the Landshut-Plattling ST line, and Pocking on the branch line Simbach-Passaul.

From Mühldorf, the line follows left bank of the R. Inn to Simbach, where the main line crosses the Inn and the German-Austrian frontier to Ried, Linz and Vienna, whilst the branch to Passau continues N of the river.

Track is mainly single but the line is of some importance in providing main line service to Mühldorf and Simbach, in addition to an alternative route for Linz and Vienna, to that afforded by the main DT line via Salzburg.

ROUTE 108A

MCHLDORF-NEUMARKT-ST. VEIT-LASSISHUT

General Description

Linking Mühldorf with Landshut, this line together with Route 109 provides a route for traffic from the area S of Rosenheim to N Bavaria, Leipzig and Berlin alternative to the main DT route via München.

After the junction with Route 108 at 0.5 km., the line proceeds northwards, crossing the Inn valley to proceed along the valley of a tributary to its source and thence to Neumarkt, J for ST lines to Landau on the Plattling line, and Pocking on the Simbach-Pameu line.

Fro Neumarkt he line turns NW to continue through rather hilly country along are valley of the Teyern Bach to 22-5 km. and thence proceeds through a hilly range crossing several minor valleys and finally the R. Isar shortly before joining the main electrified line München-Regensburg (Route 108) at Landaut

Gradients will most probably be severe throughout the route.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 83 in.). Standard.
- 2. LENGTH: 54-5 km. (331 miles).

ROUTE 148

MÜHLDORF FREILASSING

General Description

Together with Route 108, with which it is connected at Milliber, this line, although ST provides an alternative route between München and Salzburg to that provided by Roman 122 and 122.

From Mühldorf the line proceeds S, crossing the hilly country dividing the valleys of the R. Inn and R. Alz, w Garching (16-4 km.) I for a local branch line to Traunstein on Route 124.

From Garching the line turns SE, passing through hilly country to Laufen on the German-Austrian frontier, whence it proceeds S along the valley of the R. Salzach to join the main line from München.

ROUTE 109

ROSENHEIM-MUHLDORF

General Description

Connecting at Rosenheim with Rosts 123 from Innatruck, in addition to Rosts 124 from Salaburg; this line, which is ST throughout, together with Rosts 108 and 108, provides means for through services for traffic from places S. of Rosenheim, to N Bavaria, as an alternative to the main line via München.

The line follows the course of the R. Inn, which it crosses at 36-5 and 47-8 km., and gradients therefore are not considerable, the only point where gradients are likely to be restrictive being between Wasserburg and Gars.

At Wasserburg the line is joined by a local branch line from Grafing on the main München-Rosenheim line, but the capacity of this line would be very light and the line is only of local importance.

ROUTE :10

BASEL DRB PBY-LORRACH SCHOPEEIM-SÄCKINGEN

General Description

This ST line, which provides an electrified local service to the area around Basel on the German side of the R. Rhine, affords also a service to Sackingen alternative to that provided by fout. 113.

The line follows the valley of the R. Wiese to Schopfheim, where it turns E via a long tunnel c. 3 km. long under the Kurnberg to enter the narrow valley of a further tributary and proceed S to join the main line at Sackingen.

A J at Lorrach connects with a loop line from Weil MY, and at Schopfheim an electrified branch line to the N connects with Zell, where interchange facilities exist with a narrow gauge line running further N into the mountains to Todtnau.

Sources for supply of power are at Rheinfelden and Ryburg-Schworstadt.

ROUTE in

BASHI-PREIBURG-OPPENBURG-APPENWEIER

neval Description

Together with State 75 and 69, this line provides the only direct main line service from the Swim frontier to Karlarthe, Mannheim and Frankfurt.

Forming one of the oldest German trunk lines, was originally built to the Irish gauge (1-60 m.) Just as converted to standard gauge in 1835.

Running N from Best between the Schwarzwald could hilly district) and the Rhine, the line at at closely skirts the hillside, with 9 tunnels between lingers and Kleinhoms.

After Schliengen (955 km.) the line descends into the Rhine valley and for the rest of the journey runs in fairly straight stretches over more level country, crowing many streams and a few rivers, and carried ushy ground by embanks

The exit from Bessl is particularly vulnerable from he point of view of bridges, the R. Wiese establing to less than 10 bridges of c. 70-90 m. for the main ine and connections serving the MY, goods yard and connections

At Freiburg a deviation is made to serve the town, while goods traffic and through trains run over an avoiding line running direct from Leutersberg to Gandelfingen.

The principal junctions, in addition to Basel where connections exist with the Swim Federal Railways over the Rhive and with Rosts 113 to Singen and Konstanz, are at Mülheim with Rosts 111d from Mälhausen, at Freiburg with Rosts 111e from Colman, and Rosts 111b to Donaucschingen and at Appenwaier with the main line Strasburg-Karisrühe (Rosts 75).

ROUTE 111A COLMAR-FREIBURG

General Description

Although only ST, this route is of some strategic importance in providing one of the few crossings of the Rhine connecting the Busel-Muliouse-Strasbourg-Luxembourg line (Roste 5, I.S.T.D. C/320) on the French side of the Rhine with the Basel-Appenweier-Karlsrühe line (Rostes 111 and 75) on the German side.

There are no steep gradients, the greatest being 1 in 84, and the minimum radius of curves is 600 m.

The line is particularly vulnerable from the point of view of bridges, the most important being that over the Rhine at 20 km.

ROUTE :::B

FREIBURG-NEUSTADT-DONAUESCHINGEN (HOLLENTAL BAHN)

General Description

Linking the Rhine at Freiburg (Route 211) with the Danube at Donaueschingen (Route 112) this line is one of the most heavily graded in Germany.

Originally, a Klose rack section was employed between Hirschsprung and Hintersarten where the heaviest grades of 1/18 obtain, but the rack was dispensed with upon electrification of the line. Length of the rack section was 7-2 km. (4½ miles), the culminating point, between Holsteig and Hintersarten, being 893 m. (2,930 ft.) above sea level or 624 m. (2,047 ft.) above the starting point.

Power is obtained from the industrial supply at rower is obtained from the industrial supply at 50 cycles through Scott-connected transformers at Titisee, the tension of the contact wire being so K.V.; 2,000-h.p. electric locomotives have replaced the former s-6-2, and o-6-2 tank locomotives.

Engineering works include 12 tunnels of total length 2,091.1 m. and several bridges over rivers and streams, the most important being marked by an asterisk in the itinerary.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 8} in.). Standard.
- 2. LENGTH: 81.9 km.
- 3. TRACK: Single.

Freiburg-Hüfingen (79.3 km.), single. Hüfingen-Donaueschingen (2.6 km.), double.

4. Maximum permissible axle load:

Freiburg-Neustadt, 20 metric tons. Neustadt-Donaueschingen, 16 metric tons.

5. MAXIMUM ORADIENT:
Hirschsprung-Hinterzarten, 55 per mille (1 in

18). Remainder of line, 25 per mille (1 in 40).

6. MINIMUM RADIUS OF CURVES: 225 IL.

- 7. TRACTION: Electric between Freiburg and Neustadt—supply taken from industrial system at 30-K.V., 50-cycle, single-phase.
- 8. MARIHUM DISTANCE RETWEEN STATIONS: Section-Freiburg-Neustadt, 9·7 km. Section Neustadt-J at Hüfingen, 6·7 km.
- 9. ENGINE MEETS: Freiburg. Villingen (on Route 112).
- 10. MARSHALLING FACILITIES: Freiburg.
- 11. WATERING PACIFITIES: No details.
- 12. VULNERABLE POINTS: Marked with asterlik in
 - (a) Marshalling and locomotive facilities at
 - F. ciburg.

 (i) Junctions at Freiburg, Titisee and Donaueschingen.
 - (c) Bridges, at 0.9, 1.0, 10.2, 10.7, 11.2, 33.0-35.0, 38.4, 46.9, 50.3, 58.2, 67.3, 68.4 and 77.7 km.
 (d) Tunnels at 19.1, 26.8, 27.5, 48.9, 49.9 and

 - 51.1 km.
 (e) Electric sub-station at Titisee.

13. CAPACITY:

Trains per day Net train load tons military stores each way

Throughout electric traction 12 (Line could not be effectively worked by steam traction unless rack section were re-introduced.)

ROUTE :::A

HAUSACH-EUTINGEN (MURGTALBAHN)

This line, which is s.o. and ST, connects the Offenburg-Konstanz line (Route 112) at Hausach with the Immendingen-Stuttgart line (Route 114) at

The line runs through the Black Forest as far as Freudenstadt following the valley of the R. Kinsig to Lossburg-Rodt—there are a number of bridges over this river.

There are a number of short tunnels on the line and between Lossburg-Rodt and Eutingen some viaducts over valleys.

The line is heavily graded climbing from Hausach to Freudenstadt to 756 m. (2,480 ft.) above sea level, with gradients of 50 per mille (1/20), restricting the 0-10-0 T locomotives to hauling only 3 or 4 four-wheeled carriages. From Freudenstadt gradients tend to fall for the rest of the journey.

General Details

BASEL DRB-WALDSHUT-OBERLAUCHRINGEN-SINGEN

General Description

Together with Route 75, 122, 222, this line provides the main line service, between Karlsrühe and Konstanz, via Basel.

The line follows the right bank of the Rhine to Waldshut, I for a ST line to Turgi and Zürich. At Waldshut the line leaves the Rhine, and after crossing the valley of the R. Schlucht follows the Wutach to Oberlauchringen, J for the ST line to Hirtschingen (Route 1736). At Oberlauchringen, the line crosses the Wutach and enters the valley of the R. Klinger, pruceeding on a rising gradient over the Swiss frontier at Erzingen (75.2 km.) to rejoin the Rhine at Schaffhausen, J for a ST electrified line to Egisau and Zurich. The line then crosses the Fulsch and follows this river northwards to its source, and thence winds in way through various valleys to Singen, J with the its way through various valleys to Singen, I with the Black Forest Railway from Offenburg (Roste 112), the German-Swiss frontier being crossed again at Bietingen (104.2 km.).

In spite of the alignment following rivers and valleys, gradients are fairly high (1 in 62), but not so difficult as those on the Black Forest line, the alternative main line to Konstanz from the Karlsrühe direction.

General Details

- 1. GAUOR: 1435 mm. (4 ft. 81 in.). Standard.
- 2. LENGTH: 113.4 km. (704 miles).

ROUTE 113A

OBERLAUCHRINGEN-HINTSCHINGEN

Connecting Routes 113 and 118, this ST line, in spite of its heavy gradients, sharp curves and low permissible axis load, is of great importance in providing the only means for through service for military movements between Basel and Singer without cressing the Swiss frontier as Route 113 does.

The line follows the valley of the R. Wutach to The line follows the valley of the R. Wutach to Wiezen on a rising gradient, and thence follows its tributary the R. Mühl, necessitating, in order to minimise the heavy gradients which would otherwise be incurred, a complete spiral and a helical tunnel, followed by 4 more spiral turns in crossing the mountainous region to the Aitach valley. Altogether 6 tunnels are involved of a total length of 4,550-5 m., and a detour of 25-6 km. (15-9 miles) compared with the distance of 10-2 km. (6-3 miles) as the crow flies between Wiezen and Blumberg.

Bridges are frequent throughout, the most impor-tant being over the Danube at 60.9 km.

IMMENDINGEN-TUTTLINGEN-ROTTWEIL-EUTINGEN-HERRENBURG-STUTTGART

General Description

With connections at Immendingen with the Black Forest Railway, Offenburg-Konstanz (Route 112), this line provides a main line service from Zürich and Konstanz to Stuttgart, where it connects with Route 75 for Heilbronn, Würzburg and Berlin.

From Immendinger the line proceeds along the left bank of the Danube for 76 km, when it crosses the river to follow the right bank of the river, converging at 86 km, with the fast line connection from Konstanz via Hattingen.

At Tuttlingen, after a facing connection to the ST line to Ulm (Route 115), the line becomes ST to Sulz, and crosses the Danube to proceed with a rising gradient along the valley of a tributary to its source near Spaichingen. It then descends the valley of a tributary of the Neckar to its confluence with the Neckar at Rottwell, J for 2 local branch lines connecting with Villingen on Route 12s, and with Ballingen on the ST line Sigmaringen-Tubingen.

From Rottweil the line follows the Neckar with many sharp curves and bridges on a falling gradient to Horb, J for the ST line to Tubingen, Plos hugen and Stungart (Rode 115), and soon after Horb enters a tunnel of joo me and mens N and NE to Futno (etc.) J for the connecting line do n Hustich (Rode 1222), and the ST alternative flow to Studgest via Color.

From Stating a third concernds an expect to only security to Harristonia, somewhat a concept to a ST to the control of the con

 $(A, \sigma^{(1)}, \sigma, \tau_{s})$, whether (A, σ, τ_{s}) is a substitution of

The track ': double, apart from the section between Rottwell and Sulz, for which, however, doubling was under consideration, and may now have been carried out.

HORB-TÜBINGEN-REUTLINGEN-PLOCHINGEN (STUTTGART)

General Description

Providing a route between Horb and Stuttgart alternative to Rivie 114, the line runs ST 40, along the Neckar valley to Tubingen, J for the ST line from Sigmaringen.

The line runs DT electrified from Tübingen and at Kirchentellindurt (383 km.) deviates from the Neckar, proceeding along the valley of its tributary the Echaz to serve the important town of Reutlingen, I for a cross country branch line to Scheiklingen on the Tuttlingen-Ulm line (Route 116), and from Reutlingen crosses fairly hilly country to rejoin the Neckar at Neckartaillingen and to follow the right bank of the river to Plochingen.

At Plochinger, the line crosses the R. File and joins the main DP electrified line Ulm Smittens (R 17 20).

The principal is culture are at the exact the main the lame and gen Suntagart of the exact the gen such the SU in an large form \$1.00 to \$

TUTTLINGEN-SIGMARINGEN-HERBERTINGEN-ULM

General Description

Connecting with Route 114 at Tuttlingen and R. 216 32 at Ulm, this ST line provides an important cross country service from SW Baden area (Rusel, Freiburg and Konstanz) to the main W-E line at Ulme

The line follows the valley of the Danube from Tuttlingen to Ehingen, whence it proceeds along the valleys of its tributaries, the Schmiech, the Ach, and the Blau; gradients are not therefore severe, but from Ehingen to Schelkingen the tendency will be for the gradient to be a rising one, the peak being at Schelklingen where it crosses from the valley of the Schmiech to the valley of the Ach.

Several important bridges are encountered purriculture from Findingen to Eblingen cour the Dimine, and soon long time dist Prior generally when you are song the adoptional counter.

Actions Control of Control of Patricipes with the Action of the Control of Patricipes with the Action of the Control of Patricipes with the Science of the Control of the C

and at Scheiklingen with the ST branch line from Reutlingen, which involves a rack section in crossing the Rauhe Al's.

General Details

RADOLPZELL-FRIEDRICHSHAFET AULENDORF-ULM

General Description

Linking up with Route 112 (Offenburg-Konstanz), this line provides the main service from Konstanz and Friedrichshulen to Ulm, where it connects with Route 82, and Stuttgart.

From Radolfzell, J for Konstanz, the line runs N through slightly hilly country to Stahringer when it crosses the delta of the Stockacher-Aach to run along the N shore of Lake Konstanz to Oberuhldingen, where it deviates inland to Priedrichshafen.

From Friedrichshafen the line runs N and DT along the valley of the Schüssen to its source just N of Aulendorf, when it crosses into the Riss valley to the rivers confluence with the Danube at Erhach, whence it follows the Danube to Ulm.

Gradients are slight and have a tendency to rise to Aulendorf and thence fall to Ulm (see Plan 52).

Principal junctions are at Radolfeell, for Konstans, Friedrichshalen for Lindau (Route 1170), Aulendorf for ST lines W to Herbertingen and E to Memmingen, and at Ulm for the Stuttgart-München main line.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 84 in.). Standard.
- 2. LENGTH: 152-6 km. (101 miles).
- 3. TRACK!

ROUTE 117A FRIEDRICHSHAFEN-LINDAU

General Description

This line runs along the N side of Lake Konstanz and joins the Radolfzell-Friedrichshafen-Ulm line (Route 117) to the Lindau-Augsburg line (Route 120). There are no gradients of any consequence.

Principal junctions: Friedrichshafen for the Radolfzeli-Friedrichshafen-Ulm line; Lindau for the DT s.o. Lindau-Augsburg line (Route 120) and the ST s.o. line to Bregens.

General Details

- 1. GALGE: 1435 mm. (4 P. 81 in.). Standard.
- 2. LENGTH: 23.9 km. (14 miles).
- 3. TRACK: Single.
- 4. MARINUM PERMISSIBLE AND LOAD: 30 metric tork
- 5. MAXIMUM GRADIENT: 8 per mille (1 in 125).
- 6. MINIMUM RAINIUS OF CURVES: 300 m.
- 7. TRACTION: Steam,

8. MAXIMUM DESTANCE BETWEEN STATIONS:

Friedrichshafen-Eriskirch 5.8 km. (31 miles).

Q. ENGINE SHEDS:

Lindau.

Friedrichshafen.

IO. MARSHALLING FACILITIES:

Friedrichshafen (SY). Lindau (SY).

11. WATERING PACILITIES.

Lindau. Friedrichshafen.

- 12. VULNERABLE POINTS:
 - (a) Locomotive sheds at Friedrichshafen and Lindau.
 - (b) Repair shops at Friedrichshafen.
 - (c) Junctions at Friedrichshafen and Lindau. (d) Bridges at 1.5, 6.3 and 10.8 km.

13. CAPACITY:

Trains per Lip Not train load tons rack usay military stores.

KEMPTEN-MEMMINGEN NEU CLM

General Description

Connecting with Route san (Lindau-Augsineg) at Kempten and thate 92 at Ulm, this source forms part of the main line from Lindau and Switzerland to Frankfurt via Karlsrühe, Heidelberg and Mannheim.

The line rurs in a northerly direction following the valley of the R. Iller throughout, and gradients are consequently not of a serious nature.

The principal junctions are at Kempten with the Lindau-Augsburg line (Route 120), at Memmingen with the ST main line to Büchlor and München (Route 119), and the ST branch line from Aulendort (on Route 117), and Hergatz (on Route 120), and at Neu Ulm with the main München-Stuttgart line (Roule 82).

General Details

MEMMINGEN-BUCHLOE-MÜNCHEN

Together with Route 118, the section Memmingen-Buchloe provides a ST alternative route from Kempten to Buchloe and from Buchloe the line continues to München providing, together with Route 120, the main line service from Lindau and Zürich to München, Leipzig and Berlin.

The line proceeds in an easterly direction crossing the general watershed to the N and includes bridges over several rivers, the most important being those over the Gunz, Mindel, Wertach, Lech and Amper.

In addition to the important connections at Memmingen, Buchloe and München, junctions at Mindelheim with the line to Günzburg and at Turkheim, Kaufering and Geltendorf with the fines to Generalsauen, Bobingen and Mering, provide less important branch line services.

General Details

LINDAU HBF-KEMPTEN-BUCHLOE-AUGSBURG

General Description

This line is DT and s.o. throughout and forms part of the main line from Zürich (Switzerland) to Augsburg and Nürnberg. The gradient is principally a rising one to Günzach and there are many sharp curves on this part of the line. From Oberstauffen to Immenstadt the course of the R. Ach and the shores of the Alp See are followed.

From Günzach to Augsburg the gradient is princi-pally a falling one. At Kaufbeuren the R. Wertach is crossed and the line follows the valley of the river to Augsburg. At Kempten the R. Iller is crossed.

Principal junctions are at Lindau, with the ST s.o. line from Friedrichshafen and with the ST line from Feldkirch and Innsbruck (s.o. from Bregenz and clearified from Bregenz to Innsbruck). Kempten J. Franction; Steam, offerribed from Bregenz to Innsbruck. Kempten J. S. Maxim & Drance Dr. s.o. line from Neu Clm. Bushloe J. for Dr. s.o. line to Munchen and for \$P s.o. line from 9.9 km, 61 m. Memoringen, Augsburg for the DT electrified line from Stattgart to Munchen, the DT electrified line from Pontaneouth, and the ST to, line from Leaderth.

LINDAU-INNSBRUCK

General Description

The line leaves the island on which Lindau is situated, crosses part of the Bodensee (Lake Konstanz) by a causeway and after reaching the mainland keeps close to the shore until reaching Bregenz. It then runs S through the wide Rhine valley, intersected by many streams, to Feldkirch. Here it turns SE to follow the narrower valley of the R. Ill, with rising gradients, to Bludenz. At Bludenz it leaves the R. Ill and follows the valleys of the Alfenz, Rosanna and Senna to Landeck, where the broader valley of the R. Inn, with casier gradients, is joined and followed to Innsbruck. Severe gradients, sharp curves, numerous bridges and several tunnels—including the famous Arlberg Tunnel—are met with in the Bludenz-Landeck section. The line crosses the 700 m. contour-line just after entering the Alfenz valley, passes under the 1,800 m. contour-level in the Arlberg tunnel and descends to river level at Landeck.

Apart from the causeway over the Redensee (c. 350 m, long) the main bridges are (i) over Bregenzer Ach at 13:2 km., (ii) over R. III, at 40:5 km., (iii) over R. III, at 50:7 km., (iv) over Tricanna Gorge, at 123:7 km., (v) over R. Lin, at 130:7 km., and (vi) over Otab fer Ache, it 130:7 km.

The are completely for kings, there is being at 76 y king of our large king and it of the king both a footnoor our large at 75 y king and it of the king both a footnoor our large king a King at 16 y king a footnoor our large king at 16 y king a footnoor our large king at 16 y king a footnoor our large king at 16 y king a footnoor our large king at 16 y king a footnoor our large king at 16 y king a footnoor our large king at 16 y king at 16 y king a footnoor our large king at 16 y k

Main junctions are at 1.2 km. (J with Route 120), at 11.1 km. (J with Bregenzerbahn, length 35.3 km.), at 13.6 km. (J with ST s.o. line to St. Margrethen and Switzerland), at 45.5 km. (J with ST electrified line to Swiss frontier and St. Gallen), at 202.3 km. (J with Route 122), and at 203.8 km. (J with Route 123a).

The line is ST throughout, being s.o. from Lindau to Bregenz, and electrified from Bregenz to Innsbruck. Sub-stations are at Feldkirch, Flirsch, Roppen and Zirl.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.
- 2. Lenarit: 204-t km. (126) miles).
- 3. TRACK: Single.
- 4. Maximum permissible axi e lond;

Lindau Bregenz, 20 metric tons. Bregenz Annsbruck Hbf, 13 metric tons.

- MAXIMUM GRADIEST: No details, but will be severe after leaving Feldkirch. The ruling gradient between Bludenz and Langen is 31 per mille.
- 6. Mixing services or centres; 250 m

ROUTE 122

INNSBRUCK-PARTENKIRCHEN-WEILHEIM-MUNCHEN

General Description

The line crosses to the left bank of the Inn soon after leaving Innsbruck, runs W, and climbs steadily from 600 m. to the Martinswand tunnel. Emerging from this, it climbs steeply to another tunnel (1,000 m. contour-level). From this second tunnel it continues climbing to Reith, where it turns N and follows a succession of small valleys to Mittenwald. Between Seefeld and Scharnitz, on this section, the line reaches the 1,300 m. contour-line, and th a descends to 1,000 m. At Mittenwald the line swings W, following the wide last valley to Partenkirchen. Here it turns N, following the Loisach valley to Murnau. From this point the line runs through more open country, passing the Staffel See and Wurm See en route. The main road is followed closely from Innsbruck to Murnau.

This line forms an alternative to the Innsbruck-Kulttein Resenheim route (Rosto 123). Frack is single to Tutzing, and double from Tutzing to Munchen. Line is electrified throughout.

Main junctions are at Innsbuck (J with DT electrified line from Brenner, Rode 1279), Innsbruck W. J with Rode 1221, at 57 to km. (J with ST electrified line to Reatte, whence ST 5.0. line to Kempton, S. dis 173 and 1205, at 1092 km. (J with ST 200 to 6 to 16 senderg, whence ST 6.0. connections to flower 177 and 1205, at 1050 km. (J with R. 20110), at Grand 2, double line to Mondaen's at 178 2 km. J with DT dead-end electrified line to RpS of

Neuaubing), at 150.2 km. (J with Routes 119 and 82), and at 150.0 km. (J with Route 123).

at S end, c. 300 m. long, access from N. Transhipment shed

140 × 14 m. SR.

Main bridges are at 2.3 km. (over R. Inn), at 152.3 km. (fly-over), and at 154.7 km. (bridge over multiple tracks).

There are several tunnels in the Innsbruck-Reith section, the main ones being at 110 km. (Martinswand, c. 25 km. long), and at 15t km. (tunnel c. 15 km. long, built on a N-S curve).

KUSFTEIN-ROSENHEIM-MÜNCHEN

ral Descriptio

The line runs in a northerly direction to Rosen-heim along the valley of the R. Inn, keeping close to the main road, and crossing the old Austro-German border at c. 3.1 km. from Kulterin. At Rosenheim it leaves the main road, and turns NE to München across high, open country on the 500 m. contour-level.

The line crosses several streams, but no important rivers. There is, however, an important bridge over a canalised stream just E of Rosenheim station (marked with asterisk in text), and a road overbridge W of station (also marked with asterisk).

Main junctions are at Rosenheim (with DT electric line from Salzburg; also J with ST s.o. alternative route to München via Holzkirchen; also J, with ST s.o. line to Mühldorf, and a light railway connection with Westerndorf); at Grafing, J with ST s.o. line to Wasserburg, on Rosenheim-Mühldorf line (Rosto 109), and at München with Reutes 82, 87, 106, 119 and 122.

This line together with Route 123e provides the main route from Italy to Germany via Insubruck. An alternative route exists from Insubruck via Partenkirchen (Route 122), but the track is single to Tutzing, and many serious gradients are to be expected.

A further alternative route to Rosenheim is afforded via St. Johann and Salzburg, Rose 124, but again heavy gradients are likely to be encountered, particularly between Worgl and St. Johann, and in addition, a kilometrage of 280-6 km, is entailed for the journey Worgl-Rosenheim as against 47.3 km. by Routes 1250 and 123.

General Details

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.
- 2. Lesorn: 99/2 km, (61] miles).

- 3. TRACK: Double.
- MARDEUM PERMISSIBLE ARLE LOAD: 20 metric tons.
- MARNUM GRADIENT: 12 per mille (1 in 81).
- MINIMUM RADIUS OF CURVES: 250 III.
- TRACTION: Electric.
- 8. MARINUM DISTANCE BETWEEN STATIONS: 7'9 km.
- 9. ENGINE SHEDS:

Kufstein. Rosenheim.

München-Ost. München-Pasing.

ROUTE 123A

BRENNER-INNSBRUCK-WÖRGL-KUFSTEIN

The Brenner railway runs from München via Kufistein, Wörgi and Innsbruck to Bolzano, Trento and Verona. It is the shortest and most important supply route between Germany and Italy. It is DT (with the possible exception of the Kufistein-Wörgi section) and electrified throughout, but there is a change of system at Brenner from the Austrian standard of 15,000 wolts A.C. to the Italian system. Electrification has considerably increased the capacity of the Austrian section of the line, which is built on a continuous upgrade from Innsbruck to Brenner, usually of 25 per mille.

Between Brenner and Innsbruck the line follows the narrow, winding and thickly wooded valley of the R. Sill, usually running on a shelf above the river. There is a loop E at St. Jodok. The Sill valley is also followed by the Brenner road, which often runs on the opposite side to the railway. Tunnels are frequent, though there is no tunnel at the pass itself, and there are several bridges over the R. Sill.

Marshalling is carried out at Innsbruck, as facilities at Brenner are limited. The small amount of level ground between Innsbruck and Brenner (and also between Brenner and Bolzano in Italy) leaves little room for loops, sidings and yards, and makes some of the station layouts rather cramped. This does not prevent the line, capacity being high, but the consequences of a block on the line from any cause for more than a few hours are likely to be felt as far N as Munchen, and as far S as Verona, since there are so few sidings where trains could be held back.

At Innsbruck the line enters the Inn valley, which it descends for the remainder of its length. Between Innsbruck and Kufstein the valley has an average width of t-2 km., with hills, often woulded, rising steeply beyond. This section of the Brenner route, in marked contrast to the section between Brenner and Innsbruck, has very easy gradients and comparatively few curves, usually of wide radius. The main engineering works are 3 large bridges over the Inn, the first of which occurs immediately N of Innsbruck, the second just W of Brixlegg (80.9 km.), and the last between Wörgl (90.5 km.) and Kußtein.

The only J of any importance occurs at Word, whence runs a DT s.o. line WSW to Schwarzach-St. Veit and thence N to Salzburg (Raw 124). At Word Row 1212 then turns NNE, still in the Inn valley. Kuti in is reached at topig kin,, and the former Amostlerman border is crossed at 112/2 km, the the committee a generally northerly direction in the Law offer to Rosenheim (for Manchen). There is your lather whether the World Note in section is of the Contraction of the period of the distributes Secretary in the second

General Details

- 1. GAUGE: 1435 mm. (4 ft. 81 in.). Standard.
- 2. Lanoru: 109-9 km. (68) miles).
- 3. TRACE: Double, except between Worgl and Kufstein, though this section may now have been doubled.
- MAXIMUM PERMINELE AXLE LOAD: 20 metric tons.
- 5. MAXIMUM GRADIENTS:
 - 25.5 per mille down between Matrei and Patsch.
 - 9.5 per mille up between Schwaz and Jenhach.
- 6. MINDOUM RADIUS OF CURVES:
 - 235 m. between Schaftenau and Kustein.
- 7. TRAGTION: Electrified (15,000 volts A.G. single-phase, 16‡ cycles). Sub-stations at Matrei, phase, 168 cycles). Sub-stations at Matrei, Solbad Hall and Worgl, deriving power from Ruets and Achensee power stations, and Walchensee power station in Bavaria.
- 8. MAXIMUM DISTANCE BETWEEN STATIONS: 8-6 km, (51 miles) (Matrei-Patsch).
- ENGINE SHEDS:

Engineering works Details and facilities Stations Km. Line crosses the former Austria 112.2 German border and continues in

a generally northerly direction, in the valley of the Inn, to Rosenheim (for München). Line continues to München as Roule 123.

BOUTE 184

worgl-st. Johann-Salzburg-Rosenheim

Connecting with Route 129s (Brennero-Kulitein) this line forms the main route from Italy to Salzburg, where it connects with the main lines from Vienna and Linz, before proceeding W to Rosenheim and München.

The principal junctions are at Word with Routs 1236 direct line from Innabrack to München, at Schwarzach-St. Veit with the ST electric line from Villach (Routs 125), at Salzburg with the main line from Vienna and Linz, and at Rosenheim, where it once more joins Route 123.

The line is DT and electrified throughout and passes through mountainous country, giving a maximum gradient of 23 per mille up and 22:3 per mille down. Double heading is required where these gradients occur, i.e. in the sections St Johann-Hochilzen, and Hichfilzen-Saalfelden. See Plas 51 giving profile of line.

The line is particularly vulnerable from the point of view of tunnels and bridges, the most important of the latter being between Bruck-Fusch and Salzburg where : e line follows the R. Salzach.

General Details

General Description

Note km. distances are given from Jesenice.

This is one of the few routes leading from Germany to Italy. Lines from the Balkans and Trieste converge on Jesenice in Yugoslavia; from here trains can either run N through the Karawanken tunnel to Rosenbach and Villach, or W to Tarvisio, and thence NE to Arnoldstein and Villach. From both Rosenbach and Villach lines run E to Klagenfurt (for Wien). Here the tracks divide, one branch running directly to Villach Hauptbahnhof, one bypassing this station and rejoining these lines E of it, and Route 125 turning sharply W to Lind Junction where it meets another connection from Villach Hbf. The line is DT from Warmbad Villach to Spittal.

Now follows the easiest section of the line. On a very gentle upgrade with few curves the line ascends the Drau vailey in a general NW direction, keeping close to the steep left (NE) side of the valley and generally close to the river. At Spittal Millstattersee (72.8 km.) the line becomes ST and electrified and the Tauern line proper begins.

For approximately 5 km, the Tauern line and the ST s.o. line to San Candido in the Italian Dolomites run side by side. The San Candido line then turns away to the W up the Drau valley and the Tauern line begins its long avent up the E side of the Molt I'al at an average gradient of 27th per mille. The most difficult section of all is from Penk to Obervellach 3043-tot of km2, where the side of the Molt I'al is broken by ravines and the line has to make long curves in timels and cross high virducts to negotiate them. At Obervellach, the station is poor in above the value field randick currected with the village by a facility of

The line leaves the Moll Tal and ascends the valley of the Mallnitz, which is a gorge for the first 3 km. It then runs through the 8,551 m. long Tauern tunnel and emerges near the head of Gasteiner Tal on the N side of the Tauern range. From Bockstein, the station at the tunnel entrance to Bad Gastein (123.5 km.) the line runs along the E or right side of the valley, it then crosses the river just S of Bad Gastein station and immediately runs high up along the western side of the valley, the river running first in a gorge (at Bad Gastein itself), and then in a narrow flat-bottomed valley. Between Bad Gastein and Hofgastein (123.5 to 134.4 km.), and most notably between Angertal and Hofgastein, the line crosses numerous viaducts, runs through short deep cuttings, and winds continuously.

At Hospastein (1344 km.) the railway descends to the valley floor and runs on an embankment alongside the Gasteiner Ache. N of Klammstein (1445 km.) the river enters the Klamm Gorge, a winding ravine with overhanging walls, and the railway crosses the river, runs through the Oberre Klamm tunnel, crosses the river again, runs through the Unterer Klamm tunnel, and finally emerges on the right-hand (S) side of the Salzach valley. It immediately curves ENE running parallel with the Worgl-Salzburgline (Route 124), crosses a further series of vialuers, runs through a short tunnel, and descends to the valley floor just W of Schwarzach St. Veit.

General Details

3. TRACE:

Iesenice-Rosenbach, double. Reminch-Warmhad Villach, single, Tarvisio-Warmhad Villach, single, Warmbach Villach-Spittal Millstattersee dead le

Spittal Millstattersee-Mailnitz, single. Mallnitz-Bockstein: Double.

Bockstein-Schwarzach St. Veit, single.

- A. MAXINUM PERMINISER AXER LOAD: 15 metric vins.
- 5. MAXINUM GRADIENT:

27-8 per mille up, frequent, between Pusarnitz and Malinitz.

28-s per mille down between Kiammstein and Schwarzach St. Veit.

6. MINIMUM RADIUS OF CURVES:

200 m. between Tarvisio and Thorl-Magiern. 250 m. frequent throughout the line.

7. TRACTION:

Jesenice/Tarvisio-Spittal Millstättenee, steam. Spittal Millstättersee-Schwarzach St. Veit, electrified. (15,000 V a.c. single-phase 16 cycles.) Power supply from Stubach and Mallnitz power stations. Sub-stations at Schwarzach St. Veit and Mallnitz. Sub-stations at

8. MAKIMUM DISTANCE BETWEEN STATIONS: (passing loops on ST sections):

Rosenbach-Warmbad Villach, 66 km. (4

miles). Spittal Millstättersee-Mallnitz, 6-6 km. (4

miles). Tarvino-Warmbad Villach: 8-5 km. (51

miles). Bockstein-Schwarzach St. Veit: 8-6 km. (5) miles).

g. ENGINE MEDS:

Arnoldstein, Jesenice, Rosenbach, Villach Westbahnhof and Hauptbahnhof, Spittal Millstättersee (probably). Schwarzach St. Veit.

10. MARSHALLING PACILITIES:

Villach Westbf. Villach Hb£ Smaller yards at Spittal Millstattersee and Schwarzach St. Veit, also at Jesenice (Yugoslavia) and Tarvisio (Italy).

11. WATERING FACILITIES:

Spittal Millstattersee. Tarvisio. Arnoldstein. Penk. Jesenice. Obervellach. Rosenbach. Mallnitz. Faak am See. Bockstein. Villach Westbfi Angertal. Schwarzach St. Veit. Villach Hbf.

12. VULNERABLE POINTS: Marked with asterisk in text.

> Most of this line presented great difficulties of construction as it runs through the Karawanken and Tauern ranges of the Alpa, Gradients are steep and curves sharp, and the only straightforward section is the 40 km, of DT between Villach and Spittal, where the line follows the Drau valley.

(a) Locomotive and marshalling facilities in l g and to above.

(6) Tunnels at 0.8 km, and 1.6 km (two tun-nels on Tarvisio-Villach section), at 3.6 km. (Karawanken tunnel), at 95.9 km. (Zwenberg-Fallenberg Viaduct and tunnels), at 95.3 km. 101.9 km. (10 lan-nels between Fink and Olesvellach), at 100.2 km. (tunnel leading to Kap-ponig viaduct), at 105.9 km. (Dosen), at 110.4 km. (Tauern), at 144.5 km. (upper and lower Klamm tunnels).

(e) Junctions at Jesenice, Rosenbach, Villach,

Klagenfurt and Lind.

(d) Bridges: At 9:2 km. and 22 km (bridges over rivers Gailits and Gail on Tarvisio-Villach section), at 30 8 km. (over R. Gail), at 36 2 km. (over R. Drau), at 86 1 km. (over Mühldorferbach), at 90 9 km. (over Ruckenbach).

At 95.9 km. (Zwenberg-Pfaffenburg viaduct), at 101.1 km. (Kapponig viaduct).
At 95.3 km.-101.9 km. (5 bridges in F.nk-Obervellach section).

At 123.5 km.-134.4 km. (11 viaducts and several smaller bridges on Bad Gastein-Hofgastein section).

At 119 7 km. (over Anlaufbach), at 125-8 km. (Winterreith viaduct), at 128-4 km. (Angertal viaduct), at 148-5 km. (Kenlachgraben viaduct).

At 114.5 km. (2 bridges over Gasteiner Ache) and at 151.1 km. (Thomersbach viaduct.

(e) Power stations and sub-stations as in (4) above.

S. CANDIDO (INNICHEN) SPITTAL-MILLSTÄTTERSEE

General Description

This is a part of the single track line which con-nects the Brenner line at bortezza with the Tauern line at Spittal-Millistateuree and is chiefly important as an alternative to either tonic. It follows the valley of the R. Draw (brave) throughout, the valley starting is a goinge and widening as it receives its tribuctions, the feel and the Molf.

General Details

- a Govern transfer of the Him . Stealard.
- L. I. Same and Second of time &
- 4 Taxix Single.

- 4. MARINUM PERMUSIBER ARER LOSD: 16 metric tons.
- 3. MAXIMUM GRADIENTS
 - 25 per mille down between Abfaltersbach and Mittewald a.d. Drau.
 - 5 per mille up between S. Candido and Vier-sich and Viersich and Weitlanbrann,
- 6. Mising a nearest or conver-
 - 2 Som Is racen S. Cambido and Lieuz.
- y. Principle Spring
- A. Marchan Borres Chamber attended. to king of the a Phal Const.

g. E. GINE SHELA!

S. Candido. Providely also shed for electric becometives at Spittal-Millettersee.

10. MARSHALLING PARILLERS:

Small yard at Spittal-Millatatteries.

11. WATERING PACILITIES:

S. Candido. Abfaltersbuch. Thal. Liens

Deltach im tutale. Kleinch-Line. Spittal.

12. VULNERABLE POINTS: Marked with asterisk in

(e) Locomotive and marshalling facilities as

(e) Locotnetive non-in 9 and 10. (b) Km. e. 42-6. Bridge user R. Isel. Km. 101-1. Bridge over R. Moll. Km. 104-9. Bridge over stream (double track).

"There is no detailed information available There is no detailed information available about the engineering works on this line but the above bridges are probably fairly large. The whole line runs between high mountains, and the Pusterial valley from S. Candido to Lienz, i.e. the upper Drau valley, is practically a yeage, the railway running high up along the side of the valley with few but sharp curves and steep gradients.

13. CAPACITY:

16 trains per day each way, of 200-250 net tons military stores.

14. SIGNALLING:

No information available.

15. TRAIN DESPATCHING:

Train control in operation, centralised at Lienz and Spittal.

16. REPAIR SHOPS:

No information available.

DEPARTMENT OF DEFENSE

DIRECTORATE FOR FREEDOM OF INFORMATION AND SECURITY REVIEW
1155 DEFENSE PENTAGON
WASHINGTON, DC 20301-1155

D 2 JAN 2000

Ref: 98-M-0165/A1

This refers to our letter to you dated October 7, 1999, regarding your appeal to the Information Security Oversight Office for 14 documents previously requested under Mandatory Declassification Review procedures. One document (AD346727) was provided to you by our letter dated November 19, 1999.

The review of 11 British documents you requested is complete and there are no objections to release. Titles of these documents are contained on the enclosed sheet and a copy of each is enclosed. We will advise you as soon as the reviews of the remaining two documents are completed

Per Dod letter, Please mark these !! documents " available to the public!"

I verified the docs could be marked available for public release via telecon with Pat Skinner, DoD Security Review, 695-9556/6428.02 21 Jan 2000, Sincerely,

Signation

H. J. McIntyre Director
